EPIDEMIOLOGIC NOTES AND REPORTS
INFLUENZA - United States

During the past week, influenza activity has been reported from 11 additional states. It has been manifested primarily by an increase in school or industrial absenteeism, by an increase in febrile respiratory illness, or by colleges closing early for Christmas vacation.

Documented outbreaks of A2/Hong Kong/68 influenza have been reported from Florida, South Carolina, and Wyoming. In addition to these states, Georgia, Iowa, Kansas, Ohio, and Oregon, which had previous influenza activity, have now documented A2/Hong Kong/68 influenza outbreaks. Outbreaks of influenza-like disease have been reported from Idaho, Indiana, Maine, Massachusetts,

INFLUENZA - (Continued from front page)

communities have ranged from 10 to 20 percent and attack rates in various institutions have ranged from 10 to 50 percent. The highest attack rates have been reported from universities and colleges, while highest absenteeism rates have occurred in the junior and senior high schools.

Currently, 40 states, the District of Columbia, and Puerto Rico have reported some form of influenza activity. The current status of influenza activity is depicted in Figure 1. As illustrated in Figure 2, the reported pneumonia-influenza deaths in 122 U.S. cities have exceeded the epidemic threshold for the second consecutive week, and pneumonia-influenza deaths in three divisions, the East North Central, Mountain, and Middle Atlantic, have exceeded the epidemic threshold for 2 or more consecutive weeks.

(Reported by E. Charlton Prather, M.D., M.P.H., Director, Division of Epidemiology, Florida State Board of Health;

Parish, Acting Director, Division of Preventive Medicine, Wyoming State Department of Public Health; and EIS Officers.)

INFLUENZA SURVEILLANCE - Pennsylvania

On December 2, 1968, the Division of Communicable Diseases, Pennsylvania Department of Health, instituted a statewide program for influenza surveillance consisting of 12 surveillance sites throughout the state to monitor absenteeism in the six state regions (Figure 3). Daily attendance reports are received from selected elementary schools, high schools, and industries, and related the same day to the Division of Communicable Diseases for analysis and further investigation if indicated. Approximately 100,000 people are included in this daily absenteeism reporting and comprise approximately 1 percent of the state's population excluding Philadelphia and Pittsburgh which have separate surveillance systems. In addition to the field surveillance, the state laboratory telephones a daily report identifying the locations of recently confirmed cases of A2/Hong Kong/68 influenza. This information, supplemented by pneumonia and influenza mortality statistics from six metropolitan areas, is analyzed, summarized, and released every 3 days to public health personnel in the state.

The purpose of this surveillance and reporting system is to provide current information on the activity of A2/Hong Kong/68 influenza in Pennsylvania and to focus

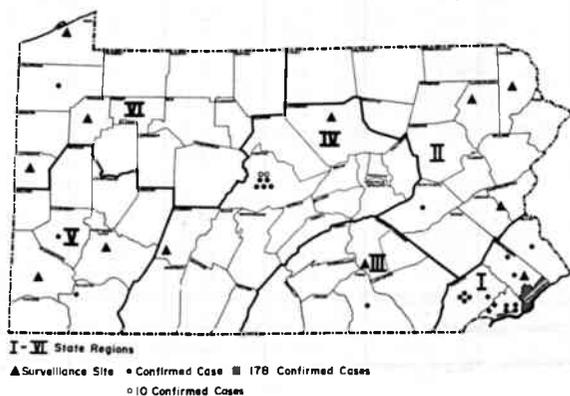

attention on areas with significantly increased absenteeism and mortality rates in an effort to secure early clinical and laboratory confirmation of influenza and to document the effects of a highly communicable virus on the daily activities of a large population group.

To date, there has been no unexpected increased absenteeism in Pennsylvania. Although the surveillance system has demonstrated absenteeism of greater than 10 percent between December 9 and 11 in 11 institutions, epidemiologic study of these institutions has revealed that these rates are either transitory rises or normal values for these institutions (Table 1). As of December 13, the state laboratory reported isolation of 222 A2/Hong Kong/68-like viruses. Of these, 178 were from residents of Philadelphia and 25 isolates were from Centre County, accounting for 91 percent of the confirmed cases. In addition, A2/Hong Kong/68-like viruses were obtained from nine other counties in the state.

EPIDEMIOLOGIC NOTES AND REPORTS
MEASLES - Rhode Island

From mid-September through mid-December 1968, an outbreak of 49 cases of measles occurred in Providence, Rhode Island. Except for several small self-limited family outbreaks, this is the first reported outbreak from Rhode Island since a statewide vaccination campaign was conducted in January 1966.¹ Most cases since the immunization campaign, have occurred sporadically, usually secondary to infections imported from out of state. In 1968, prior to this outbreak, only six cases were reported. All were traced to out of state contacts.

The present outbreak occurred in Portuguese persons, many of whom arrived in the United States after the January 1966 immunization campaign in Rhode Island. The first case, a 3-year-old boy, developed measles on September 15 while visiting in Portugal. The family returned to the United States on September 30 and that same day, the boy's 6-year-old sister had onset of illness and exposed her 6-year-old cousin. All the remaining cases have been traced to school contacts of the sister of the first case. Special immunization clinics have been conducted in this area of the city and plans have been made to immunize persons from Portugal as they arrive in Rhode Island. (Reported by Joseph E. Cannon, M.D., M.P.H., Director of Health, Rhode Island Department of Health; and an EIS Officer.)
